# LINEAR CONNECTIONS COMPATIBLE WITH THE  $F(3,1)$ -STRUCTURE ON THE LAGRANGIAN SPACE

### Jovanka Nikic

Abstract. In this paper the F-structure, satisfying  $F^3 + F = 0$  on the Lagrangian space, is examined. The construction of this structure is given as the prolongation of  $f_v$ -structure defined on  $T_V(E)$  using the almost product or almost complex structure on  $T(E)$ . Moreover, the metric tensor  $G$ , with respect to which F is an isometry, is constructed as well as the connection compatible with such structures.

### 1. Introduction

Let  $M$  be an n-dimensional and  $E$  2n-dimensional differentiable manifold and let  $\eta = (E, \pi, \mathcal{M})$  be vector bundle with  $\pi E = \mathcal{M}$ . The differential structures  $(U, \varphi, R^{-\alpha})$  are vector charts of the vector bundles  $\eta$ . Hence the canonical coordinates on  $\pi^{-1}(U)$  are  $(x^*, \ldots, x^*, y^*, \ldots, y^*) = (x^*, y^*), i = 1, 2, \ldots, n; a =$  $1, \ldots, n$ . Transformation maps on E are

$$
x^{i'} = x^{i'}(x^1, x^2, \dots, x^n), \ y^{a'} = M_a^{a'}(x^1, \dots, x^n) y^a = M_a^{a'}(x^i) y^a
$$

$$
rank\left[\frac{\partial x^{i'}}{\partial x^i}\right] = n, \ rank\left[\frac{\partial y^{a'}}{\partial y^a}\right] = rank M_a^{a'} = n.
$$

The inverse transformations are

$$
x^{i}=x^{i}(x^{1'},x^{2'},\ldots,x^{n'}), \ y^{a}=M_{a'}^{a}(x^{i'},\ldots,x^{n'})y^{a'}, \text{ where } M_{a'}^{a}M_{b}^{a'}=\delta_{b}^{a}.
$$

The local natural bases of the tangent space  $T(E)$  are  $\{\partial_i, \partial_a\},\$ 

$$
\partial_a=\frac{\partial}{\partial y^a}=M_a^{a'}(x^i)\partial_{a'},~~\partial_i=\frac{\partial}{\partial x^i}=\frac{\partial x^{i'}}{\partial x^i}\partial_{i'}+(\partial_i M_b^{a'}(x^i))y^b\partial_{a'}.
$$

The nonlinear connection on E is distribution  $N: u \in E \to N_u \subset T_u(E)$  which is supplementary to the distribution  $V$ ,

$$
T_u(E) = N_u \oplus V_u, \quad \forall_u \in E. \tag{1.1}
$$

46 J. Nikic

They are localy determined by  $v_i = v_i - N_i^T \mathcal{O}_a$ . The local bases adapted to decompositions in (1.1) is  $\{\delta_i, \partial_a\}.$ 

It is easy to prove [5] that on  $\{\delta_i, \partial_a\}$ 

$$
\delta_{i'}=\delta_i\frac{\partial x^i}{\partial x^{i'}},\quad \partial_{a'}=\frac{\partial y^a}{\partial y^{a'}}\partial_a.
$$

The subspace of  $T(E)$  spaned by  $\{\delta_i\}$  will be denoted by  $T_H(E)$  and the subspace spaned by  $\{\partial_a\}$  will be denoted by  $T_V(E)$ ,  $T(E) = T_H(E) \oplus T_V(E)$ , dim  $T_H(E) =$  $\cdots$  dimensions  $\cdots$ 

DEFINITION 1.1 If the Riemannian metric structure on  $T(E)$  is given by  $G = g_{ij}(x^i, y^a)dx^i \otimes dx^j + g_{ab}(x^i, y^a) \delta y^a \otimes \delta y^o$  where  $g_{ij}(x^i, y^a) = g_{ij}(x^i)$ ,  $g_{ab} = \frac{1}{2} \partial_a \partial_b L(x^*, y^*)$  and  $L(x^*, y^*)$  is a Lagrange function, then such a space will be called a Lagrangian space.

Let  $X \in T(E)$ , then  $X = X^i \delta_i + \bar{X}^a \partial_a$  and the automorphism  $P : \mathcal{X}(T(E)) \to$  $\mathcal{X}(T(E))$  defined by  $PX = \bar{X}^i \delta_i + X^a \partial_a$  is the natural almost product structure on  $T(E)$  i.e,  $P^2 = I$ . If we denote by v and h the projection morphisms of  $T(E)$ to  $T_V(E)$  and  $T_H(E)$  respectively, we have P  $\circ h = v \circ P$ .

## 2.  $f(3,1)$ -structures

DEFINITION 2.1. We call Lagrange vertical  $f_v(3,1)$ -structure of rank r on  $T_V(E)$  a non-null tensor field  $f_v$  on  $T_V(E)$  of type (1,1) and of class  $C^{\infty}$  such that  $f_v^+ + f_v^0 = 0$ , where rank  $f_v^0 = r$ , and r is constant everywhere.

DEFINITION 2.2. We call Lagrange horizontal  $f_h(3,1)$ -structure of rank r on  $T_H(E)$  a non-null tensor field  $f_h$  on  $T_H(E)$  of type  $(1,1)$  of class  $C^{\infty}$  satisfying  $J_h^+ + J_h = 0$ , rank  $J_h = r$ , where r is constant everywhere.

An  $F(3,1)$ -structure on  $T(E)$  is a non-null tensor field F of type  $\binom{11}{11}$  such that  $F^+ + F = 0$ , rank  $F = 2r = \text{const.}$ 

For our study it is very convenient to consider  $f_v$  or  $f_h$  as morphisms of vector bundles [2], [3]

$$
f_v: \mathcal{X}(T_V(E)) \to \mathcal{X}(T_V(E)), \ \ f_h: \mathcal{X}(T_H(E)) \to \mathcal{X}(T_H(E))
$$

Let  $f_v$  be a Lagrange vertical  $f_v(3,1)$ -structure of rank r. We define the morphisms  $\bm{u}_v = -f_v^*$  and  $\bm{m}_v = f_v^* + I_{TV}(E)$ , where  $I_{TV}(E)$  denotes the identity morphism on  $T_V(E)$ .

It is clear that  $l_v + m_v = I$ . Also we have

$$
l_v\bm{m}_v=\bm{m}_v l_v=-f_v^4-f_v^2=-f_v(f_v^3+f_v^1)=0,\;\bm{m}_v^2=\bm{m}_v,\;l_v^2=l_v.
$$

Hence the morphisms  $l_v$ ,  $m_v$  applied to the  $\mathcal{X}(T_V(E))$  are complementary projection morphisms. Then, there exist complementary distributions  $L_v$  and  $M_v$ 

corresponding to the projection morphisms  $l_v$  and  $m_v$  respectively such that dim  $L_v = r$  and dim  $M_v = n - r$ . It is easy to see that

$$
l_v f_v = f_v l_v = f_v, \ \bm{m}_v f_v = f_v \bm{m}_v = 0, \ f_v^2 l_v = l_v f_v^2 = -I, f_v^2 \bm{m}_v = 0. \tag{2.1}
$$

PROPOSITION 2.1. If a Lagrange  $f_v(3,1)$ -structure of rank r is defined on  $T_V(E)$ , then the horizontal  $f_h(3,1)$ -structure of rank r is defined on  $T_H(E)$  by the natural almost product structure of  $T(E)$ .

Proof. If we put

$$
f_h X = P f_v P X, \quad \forall X \in T_H(E), \tag{2.2}
$$

It is easy to see that  $f_h \Lambda = F f_v F \Lambda$  and  $f_h + f_h = 0$ , and rank  $f_h = r$ .

PROPOSITION 2.2. If a Lagrange  $f_v(3,1)$ -structure of rank r is defined on  $T_V(E)$ , then an  $F(3,1)$ -structure is defined on  $T(E)$  by the natural almost product structure of  $T(E)$ .

Proof. We put

$$
F = f_h h + f_v v,\tag{2.3}
$$

where  $f_h$ , is defined by (2.2), and h, v are the projection morphisms of  $T(E)$  to  $T_H(E)$  and  $T_V(E)$ , respectively. Then it is easy to check that

$$
F^2 = f_h^2 h + f_v^2 v, \ F^3 = f_h^3 h + f_v^3 v.
$$

Thus  $F^3 + F = 0$ . It is clear that rank  $F = 2r$ .

If  $l_h$ ,  $m_h$  are complementary projection morphisms of the horizontal  $f_h(3,1)$ structure, which is defined by the natural almost product structure of  $T(E)$ , we have

$$
l_h X = -f_h^2 X = -P f_v^2 P X = P l_v P X, \forall X \in T_H(E)
$$
  

$$
m_h X = (f_h^2 + I_{T_H(E)}) X = P f_v^2 P X + P I_{T_V(E)} P X = P m_v P X, \forall X \in T_H(E)
$$

If l, m are complementary projection morphisms of the  $F(3,1)$ -structure on  $\blacksquare$ , then we have the matrix we have the set of  $\blacksquare$ 

$$
l = -F^2 = -f_h^2 h - f_v^2 v = l_h h + l_v v
$$
  
\n
$$
m = F^2 + I_{T(E)} = f_h^2 h + f_v^2 v + I_{T_H(E)} h + I_{T_V(E)} v = m_h h + m_v v.
$$
\n(2.4)

Thus, if there is given a Lagrange  $f_v(3,1)$ -structure on  $T_V(E)$  of rank r, then there exist complementary distributions  $L_h$ ,  $M_h$  of  $T_H(E)$ , corresponding to the morphisms  $l_h$ ,  $m_h$  such that

$$
L_h = PL_v, \quad M_h = PM_v. \tag{2.5}
$$

Thus we have the decompositions  $T(E) = T_H(E) \oplus T_V(E) = PL_v \oplus PM_v \oplus L_v \oplus M_v$ . If L, M denote complementary distributions corresponding to the morphisms l,  $m$ respectively then from  $(2.4)$  and  $(2.5)$  we have

$$
L=PL_v\oplus L_v,\;M=PM_v\oplus M_v.
$$

Let  $\bar{g}_v$  be a pseudo-Riemannian metric tensor, which is symmetric, bilinear and non-degenerate on  $T_V(E)$   $\bar{g}_v$  :  $\mathcal{X}(T_V(E)) \times \mathcal{X}(T_V(E)) \rightarrow \mathcal{F}(T(E))$ . (For example  $\bar{g}_v$  can be the vertical part of the Lagrange metric structure).

The mapping  $a_v : \mathcal{X}(T_V(E)) \times \mathcal{X}(T_V(E)) \to \mathcal{F}(T(E))$  which is defined by

$$
a_v(X,Y) = \frac{1}{2} [\bar{g}(l_v X, l_v Y) + \bar{g}(m_v X, m_v Y)] \ \ \forall X, Y \in \mathcal{X}(T_V(E))
$$

is a pseudo-Riemannian structure on  $T(E)$  such that  $a_v(X, Y) = 0, \forall X \in \mathcal{X}(L_v)$ ,  $Y \in \mathcal{X}(M_v)$ .

THEOREM 2.1. If a Lagrange  $f_v(3,1)$ -structure of rank r is defined on  $T_V(E)$ then there exists a pseudo-Riemannian structure of  $T_V(E)$  with respect to which the complementary distributions  $L_v$  and  $M_v$  are orthogonal and  $f_v$  is an isometry on  $T_V(E)$ .

*Proof.* If we put  $g_v(\Lambda, Y) = \frac{1}{2} |a_v(\Lambda, Y)| + a_v(f_v\Lambda, f_vY)$ , it is easy to see that

 $g_v(X,Y) = 0 \quad \forall X \in \mathcal{X}(L_v), \quad Y \in \mathcal{X}(M_v).$ 

Using (2.1) we get  $g_v(f_vA, f_vY) = \frac{1}{2} [a_v(f_vA, f_vY) + a_v(A, Y)].$  Thus  $f_v$  is an isometry with respect to  $g_v$ .

Let  $X \in \mathcal{X}(L_v)$  then  $f_v X$ ,  $f_v^2 X \in \mathcal{X}(L_v)$  and

$$
g_v(X, f_v X) = g_v(f_v X, f_v^2 X) = -g_v(f_v X, X).
$$

Consequently  $g_v(\Lambda, f_v \Lambda) = g_v(f_v \Lambda, f_v \Lambda) = 0.$ 

We can define a maping  $g_h$ :

$$
g_h(X, Y) = g_v(PX, PY), \ \forall X, Y \in \mathcal{X}(T_H(E)),
$$

where  $g_h$  is a metric structure on  $T_H(E)$ . Using (2.5) the distributions  $L_h$ ,  $M_h$  are orthogonal with respect to  $g_h$  and the horizontal  $f_h(3,1)$ -structure which is defined by  $f_h X = P f_v P X$ ,  $\forall X \in \mathcal{X}(T_H(E))$  is an isometry on  $T_H(E)$  with respect to  $g_h$ .

We can also define a metric tensor G on  $T(E)$ .

$$
G(X,Y) = g_h(X,Y)h + g_v(X,Y)v.
$$
 (2.6)

The distributions L, M are orthogonal with respect to G and the  $F(3,1)$ structure which is defined by  $FX = f_h h + f_v v$ ,  $X \in T(E)$  is an isometry on  $T(E)$ with respect to  $G$ .

#### 3. Linear connections compatible with  $F(3,1)$ -structure

It is well known that an arbitrary distribution  $D$  is parallel with respect to a linear connection  $\nabla$ , if for any tangent field Y,  $\nabla_Y$  is a transformation of D [4].

DEFINITION 3.1. An  $f_v(3,1)$ -connection on  $T_V(E)$  (or a linear connection compatible with a  $f_v(3,1)$ -structure) is a linear connection  $\nabla$  on  $T_V(E)$  with the property that distributions  $L_v$  and  $M_v$  are parallel with respect to  $\nabla$ .

In a similar way  $\nabla'$  is an  $f_h(3, 1)$ -connection if distributions  $L_h$  and  $M_h$  are parallel with respect to  $\nabla'$ , and  $\nabla$  is an  $F(3,1)$ -connection if distributions L and  $M$  are parallel with respect to  $\nabla$ .

THEOREM 3.1. Let  $l_v$ ,  $m_v$  be the complementary projection morphisms of  $f_v(3, 1)$ -structure.

A linear connection on  $T_V(E)$  is an  $f_v(3,1)$ -connection if and only if

$$
\nabla_X l_v = 0 \quad \forall X \in \mathcal{X} T(E).
$$

*Proof.* Since  $l_v$  is a morphism on  $T_V(E)$ ,

$$
(\nabla_X l_v)(Y) = \nabla_X l_v Y - l_v \nabla_X Y, \quad \forall X \in \mathcal{X} T(E), Y \in \mathcal{X} T_V(E). \tag{3.1}
$$

If  $\nabla_X l_v = 0$ , then from  $l_v + m_v = I$ , we have

$$
\nabla_X \mathbf{m}_v Y = 0, \ \nabla_Y l_v Y = l_v \nabla_X Y, \ \nabla_X \mathbf{m}_v Y = \mathbf{m}_v \nabla_X Y.
$$

Since  $m_v l_v = l_v m_v = 0$ , we have

$$
\mathbf{m}_v \nabla_X Y = 0, \quad \forall Y \in \mathcal{X} T(L_v), X \in \mathcal{X} T(E),
$$

and

$$
l_v \nabla_X Y = 0, \quad \forall Y \in \mathcal{X} T(M_v), X \in \mathcal{X} T(E).
$$

Thus  $\nabla_X Y \in \mathcal{X} T (L_v)$  for every  $Y \in \mathcal{X} T (L_v)$  and  $\nabla_X Y \in \mathcal{X} T (M_v)$  for every  $Y \in \mathcal{X} T(M_v)$ .

Conversely, using the decomposition  $Y = l_v Y + m_v Y$  and (3.1) we get

$$
(\nabla_X l_v)(Y) = \nabla_X l_v Y - l_v \nabla_X l_v Y - l_v \nabla_X m_v Y.
$$

Since  $\nabla_X$  is an  $f_v (3, 1)$ -connection  $\nabla_X m_v Y \in \mathcal{X} T (M_v)$ . Consequently  $l_v \nabla_Y \mathbf{m}_v Y = 0$ ,  $(\nabla_X l_v)(Y) = \nabla_X l_v Y - l_v \nabla_X l_v Y = 0$ , because  $l_v^2 = l_v$ .

Thus:  $\nabla_X l_v = 0, \forall X \in \mathcal{X} T(E)$ .

In a similar way we have:

PROPOSITION 3.1. A linear connection  $\nabla'_X$  on  $T_H(E)$  is an  $f_h(3, 1)$ -connection iff  $\nabla'_X l_h = 0$ ,  $\forall X \in \mathcal{X} T(E)$ .

PROPOSITION 3.2. A linear connection  $\nabla_X$  on  $T(E)$  is an  $F(3,1)$ -connection iff  $\nabla_X l = 0, \ \forall X \in \mathcal{X} T(E)$ .

THEOREM 3.2. If  $\nabla_X$  is an arbitrary linear connection on  $T_V(E)$  then the operator

$$
\nabla_X = f_v \bar{\nabla}_X f_v, \quad \forall X \in \mathcal{X}T(E)
$$

is an  $f_v(3,1)$ -connection.

Proof. Applying the theorem 3.1 we have

 $(\nabla_X l_v)Y = f_v \nabla_X f_v l_v Y - l_v f_v \nabla_X f_v Y, \quad \forall Y \in \mathcal{X}T_V(E).$ 

Since  $f_v l_v = l_v f_v = f_v$ , we have  $\nabla_X l_v = 0$ ,  $\forall X \in \mathcal{X} T(E)$ , i.e.  $\nabla_X$  is an  $f_v(3, 1)$ -connection.

Let  $\nabla_X$  be a linear connection on  $T_V(E)$ . We define the linear connection  $\nabla'_X$ on the  $T_H(E)$  by

$$
\nabla'_{X} Y = P \nabla_{X} P Y, \quad \forall X \in \mathcal{X} T(E), Y \in \mathcal{X} T_{H}(E). \tag{3.2}
$$

THEOREM 3.3. If  $\nabla_X$  is an  $f_v(3,1)$ -connection on  $T_V(E)$  then  $\nabla'_X$  defined by (3.2) is a linear connection compatible with the horizontal  $f_h(3,1)$ -structure.

*Proof.* Using  $(3.1)$ ,  $(3.2)$  we have

$$
(\nabla'_X l_h)Y = \nabla'_X l_h Y - l_h \nabla'_X Y = P \nabla_X P P l_v P Y - P l_v P P \nabla_X P Y
$$
  
=  $P(\nabla_X l_v P Y - l_v \nabla_X P Y), \quad \forall Y \in \mathcal{X} T_H(E).$ 

According to theorem 3.1,  $\nabla_X l_v = 0$ , thus  $\nabla'_X l_h = 0$ , i.e. horizontal connection  $\nabla'_X$  is compatible with the  $f_h(3, 1)$ -structure.

Next, we define linear connection  $\nabla_X$  on  $T(E)$  by

$$
\tilde{\nabla}_X Y = \nabla'_X hY + \nabla_X vY, \quad \forall X, Y \in \mathcal{X}T(E). \tag{3.3}
$$

THEOREM 3.4. If  $\nabla_X$  is an  $f_v(3,1)$ -connection on  $T_V(E)$  then  $\nabla_X$  defined by  $(3.2)$  is a linear connection compatible with the  $F(3,1)$ -structure.

*Proof.* We shall prove that  $(\nabla_X l)Y = 0, \forall X, Y \in \mathcal{X}T(E)$ .

$$
(\tilde{\nabla}_X l)Y = \nabla'_h h lY + \nabla_X v lY - l \nabla'_X hY - l \nabla_X vY
$$
  
=  $\nabla'_X h (l_h h + l_v v)Y + \nabla_X v (l_h h + l_v v)Y - (l_h h + l_v v) \nabla'_X hY - (l_h h + l_v v) \nabla_X vY.$ 

Consequently  $(\nabla_X l)(Y) = (\nabla'_X l_h)(hY) + (\nabla_X l_v)vY, \quad \forall X,Y \in \mathcal{X}T(E).$ 

According to theorems 3.3 and 3.1 we have  $\nabla_{X}l = 0$ ,  $\forall X \in \mathcal{X}T(E)$  which proves the theorem.
